"Cloning and sequencing of the gene encoding a 125-kilodalto surface-layer protein from Bacillus sphaericus 2362 and of a cryptic gene.";

J. Bacteriol. 171:4178-4188(1989).

-I- FUNCTION: THE S-LAYER IS A PARACRYSTALLINE MONO-LAYERED OF PROTEINS WHICH COAT THE SURFACE OF BACTERIA.

-I- SUBCELLULAR LOCATION: Cell wall.

-I- SIMILARITY: Contains 3 S-layer homology (SLH) domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             01-OCT-1994 (Rel. 30,

::
 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                          Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1107863
```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to peptide (P1) derived from an Ag85 protein of mycobacterium (which is associated with mycolyltransferase activity and is involved in cell wall synthesis), comprising 8-11 amino acids, and capable of inducing proliferation of MHC class I-restricted CBC+ T cells in vivo. Also included are (1) a peptide comprising P1 flanked by amino acids representing antigen processing sites; (2) a polypeptide comprising the above acids representing antigen processing sites; (2) a polypeptide comprising the comprising the claimed peptides or polypeptides; (4) a vector comprising the above nucleic acid or concentration of the claimed peptides or polypeptides; (4) a vector comprising the above nucleic acid; (5) a host cell comprising the above nucleic acid or vector; and (6) detecting and/or enumerating CDB+T cells against mycobacterium, comprising tetrameric complexes of MHC (major histocompatibility group) class I and one of the claimed peptides or polypeptides. The molecules of the invention are used to prepare a vaccine against mycobacterium (e.g. Mycobacterium tuberculosis, Mycobacterium ulcerans, tuberculosis. The present sequence is an M. tuberculosis Ag85 tuberculosis. The present sequence is an M. tuberculosis Ag85 (human leukocyte antigen)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                       Melanoma-specific mutant immunogen epitope 9mer peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAR51217 is an example of a generic bradykinin antagonist peptide having a non-arcmatic residue in the 5-position. The antagonist peptide inhibits the bradykinin reponse when injected as a bolus admixture of bradykinin plus antagonist by either the ia. or iv. route of administration, or when administered as an infusion. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAR82108 are of particular interest. The immunogen can be used for partial protection in mammals against melanoma peptides which are homologous with pMel-17 are highly potent stimulators of HLA-A2+CTLs in several cell lines and can be used in immunotherapy or incorporated into immunogenic conjugates as vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bradykinin antagonist peptide; 5-position; non-aromatic residue Treatment of inflammatory reactions; reduce pain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A generic
                     AAR51217 is an example of a generic bradykinin antagonist peptide having a non-aromatic residue in the 5-position. The antagonist peptide inhibits the bradykinin reponse when injected as a bolus admixture of bradykinin plus antagonist by either the ia. or iv. route of administration, or when administered as an infusion. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                 The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
                                                                                                                                                                                                                                                                                                                             A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  14-JUN-2001

                                                                           The invention relates to the identification of complementary peptides by analysis of protein and nucleotide sequence databases from higher eukaryotic genomes, excluding human and plants. The specific complementary peptides interact with their relevant target proteins encoded in the eukaryote genome. The peptides may be used as reagents and drugs for drug discovery and as lead ligands for drug design and development. The present sequence is a complementary peptide from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           11-SEP-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAG86812;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to the identification of complementary peptides by analysis of protein and nucleotide sequence databases from higher eukaryotic genomes, excluding human and plants. The specific complementary peptides interact with their relevant target proteins
                                                                                                                                                                                                                                                                                                                                                                                            14-JUN-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAG86812 standard; Peptide; 10 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Saccharomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to the identification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nucleotide sequence databases, useful in drug design

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAR67162;
                                                                                                                                                                                                                                         AAR67153-R67163 and AAR67174-R67183 are bovine glial cell growth factor-1 (GGF-1) peptide fragments. A 30-36kD polypeptide factor known to have glial cell mitogenic activity, which includes one of the above peptide fragments in its amino acid sequence is claimed. The polypeptide can be used to treat a variety of mammalian skeletal, cardiac and smooth muscle diseases, including acetylcholine receptor deficiency.

                                                                                                                                                                                                                                                                                                           AAR86629-R86657 represent fragments of bovine glial growth factor I
(GGF-I). These fragments were obtained by lysyl endopeptidase and
protease v8 digests. These sequences have Schwann cell mitogenic
activity in the presence of foetal calf plasma. These sequences (and
human GGF2, see AAR86628) are used to stimulate mitogenesis of glial
cells, for prophylaxis or treatment of a pathophysiological condition of
the nervous system in a mammal. Also, for identification of a receptor,
for treatment of conditions of peripheral nerve damage (e.g.
centreatment of conditions of peripheral nerve damage (e.g.
demyelination/damage/loss of Schwann cells), treatment of
neurodegenerative disorders in mammals, for inducing neural
centreated by inhibiting this sequence binding to its receptor.
These peptides are also able to induce synthesis of acetylcholine
                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                 A novel polypeptide was purified from bovine pituitaries. It has mitogenic activity stimulating the division of Schwann cells, and exhibits a mol. wt. of 43-35kD when carrying native glycosylation. It was digested with trypsin and lysylendopeptidase to obtain novel peptides AAR49858-R49866 and AAR49867-R49871 respectively. When peptides AAR49860-R49866 were sequenced to completion it was found that none of these sequences is apparently related to GGF-I or GGF-II peptide sequences. A polypeptide contg. any of the sequences in AAR49858-AR49871 is claimed, as is DNA encoding each of the peptides. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC against Mycobacterium pathogens comprises at least one immunodominant epitope of at least one majorly abundant CC extracellular protein, i.e. the M.tuberculosis 110, 80, 71, 58, 45, CC 32A, 32B, 30, 24, 23.5, 23, 16, 14 or 12 kD proteins, or their CC analogues, homologues and subunits. The present sequence represents an CC immunodominant epitope from the major abundant extracellular product CC 30 KD protein. The vaccinating agents are used to protect against (or CC tuberculosis) while the epitopes can also be used to detect presence CC of an immune response to a Mycobacterium pathogen. The vectors, CC containing the DNA for the extracellular proteins, are used to transform CC cells for production of recombinant DNA molecules. More generally the DNA from other pathogens can be used in vaccines, e.g. against other CC DNA can be used, a wide range of effective compositions can be produced. CT they generate a response against the antigens most often found on CC infected cells during the infection, regardless of the strength or CC specificity of the immune response. The vaccines are easy to produce CC and less toxic than known killed or attenuated vaccines, so can be given to the monocompromised subjects, e.g. those with HIV infection.
                                                                                                                                                                                                                                                                                                                                                                            Matches

Gerived from the native 30kD major secretory protein of M. tuberculosis. CC derived from the native 30kD major secretory protein of M. tuberculosis. CC These peptides are used for splenic lymphocyte profileration assays to contain the immunodomnant T-cell epitope of the 30kD protein. The cc invention provides an agent for vaccinating mammals against Mycobacterium. The agent comprises at least one of the major abundant cc extracellular 110, 80, 71, 88, 45, 32A, 32B, 30, 24, 23.5, 23, 16, 14 or 12 kD proteins of M. tuberculosis, or at least 1 of their immunodominant cc epitopes and interleukin-12 (II-12) or MF59 as adjuvants. The agent cc containing the nucleic acid encoding the extracellular products are used to raise a protective or therapeutic immune response against cc an also be used (typically M. tuberculosis. The immunodominant epitopes detect an immune response to vaccination. Preparation of the agent does not require selection of the most immunogenic products, so large scale component are easy, resulting in a consistent, cc strong cell-mediated component) and are safe even in immunocompromised cc subjects. They prevent development of an opsonising humoral response that xx might spread intracellular pathogens.

CC These peptides are used for splenic lymphocyte profileration assays to condentify the immunodominant T-cell epitope of the 30kD protein. The CC invention provides an agent for vaccinating mammals against comproved by the immunodominant T-cell epitope of the 30kD protein. The CC extracellular 110, 80, 71, 58, 45, 32A, 32B, 30, 24, 23.5, 23, 16, 14 or CC extracellular 110, 80, 71, 58, 45, 32A, 32B, 30, 24, 23.5, 23, 16, 14 or CC epitopes and interleukin-12 (IL-12) or AF59 as adjuvants. The agent CC containing the nucleic acid encoding the extracellular products are used to raise a protective or therapeutic immune response against CC extraces a seed (typically in a cutaneous hypersensitivity test) to CC detect an immune response to vaccination. Preparation of the agent does not require selection of the most immunogenic products, so large scale production and purification are easy, resulting in a consistent, CC standardised formulation, having lower toxicity than killed or attenuated consultated component) and are safe even in immunocompromised subjects. The agents development of an opsonising humoral response that CC might spread intracellular pathonens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S

The present invention describes a method for predicting the biological activity of new receptor modulating compounds (I) using novel oligomeric CC peptides (blokeys) which have differential abilities to bind to 2 CC different receptor conformations. The method is used to identify new CC that target various receptors, which are involved in certain disease CC conditions. The system may be used as a primary screening tool to CC identify hits, to classify lead compounds from a drug screen to, CC characterise selective oestrogen receptor modulators (SERMs) in terms of CC agonist and antagonist function and to predict possible clinical effects of SERMs such as tissue and receptor specificity. The method can also be CC compounds to the fractionation of mixtures of SERMs to determine which CC applied to the fractionation of mixtures of SERMs to determine which CC may be used with other receptors (e.g. progesterone, androgen, CC epidermal growth factor, to identify, characterise and classify De used to modulators of receptor activity. Peptides comprising a LXXLL motif may be used to modulate the oestrogen receptor in treating e.g. breast and CC ovarian cancer and ameliorating the effects of menopause, including costeoporosis. AAV65439 to AAV65623 represent oestrogen receptor in the exemplification of the present invention. AAZ35740 to AAZ35745 cc invention.
